

Saola proxy event window shows no distinct residual signature

- Pre / window / post means show no step (Arm A $-1,466$ / $-1,558$ / $-1,257$ W)
- Causal detrending did not provide consistent evidence that long-term drift was masking a Saola-specific anomaly contrast; the sign reverses with window length, and the largest apparent contrast belongs to the arm whose sensor was faulty throughout
- Alert counts are inflated 22-57% by the year-level offset, most severely for the Reference arm
- Saola is a proxy event window; no per-timestep fault verification exists for this site
