

Brazil source performance on the two-feature shared contract

Pooled five-class out-of-fold matrix (row-normalised)
Macro F1 0.6840 — all 25 cells reproduced exactly

Collapsed Normal vs non-Normal
anomalous F1 0.8268 | balanced accuracy 0.8749

This establishes that the shared two-feature representation carries substantial source-domain Normal versus non-Normal discrimination, so a weak HK result cannot be dismissed as arising from a representation with no demonstrated source-domain discriminatory value.
All 25 cells of the pooled out-of-fold matrix reproduced the frozen matrix exactly.
