

Objective 3 — direct transfer, Brazil-fitted pipeline applied unchanged to Hong Kong

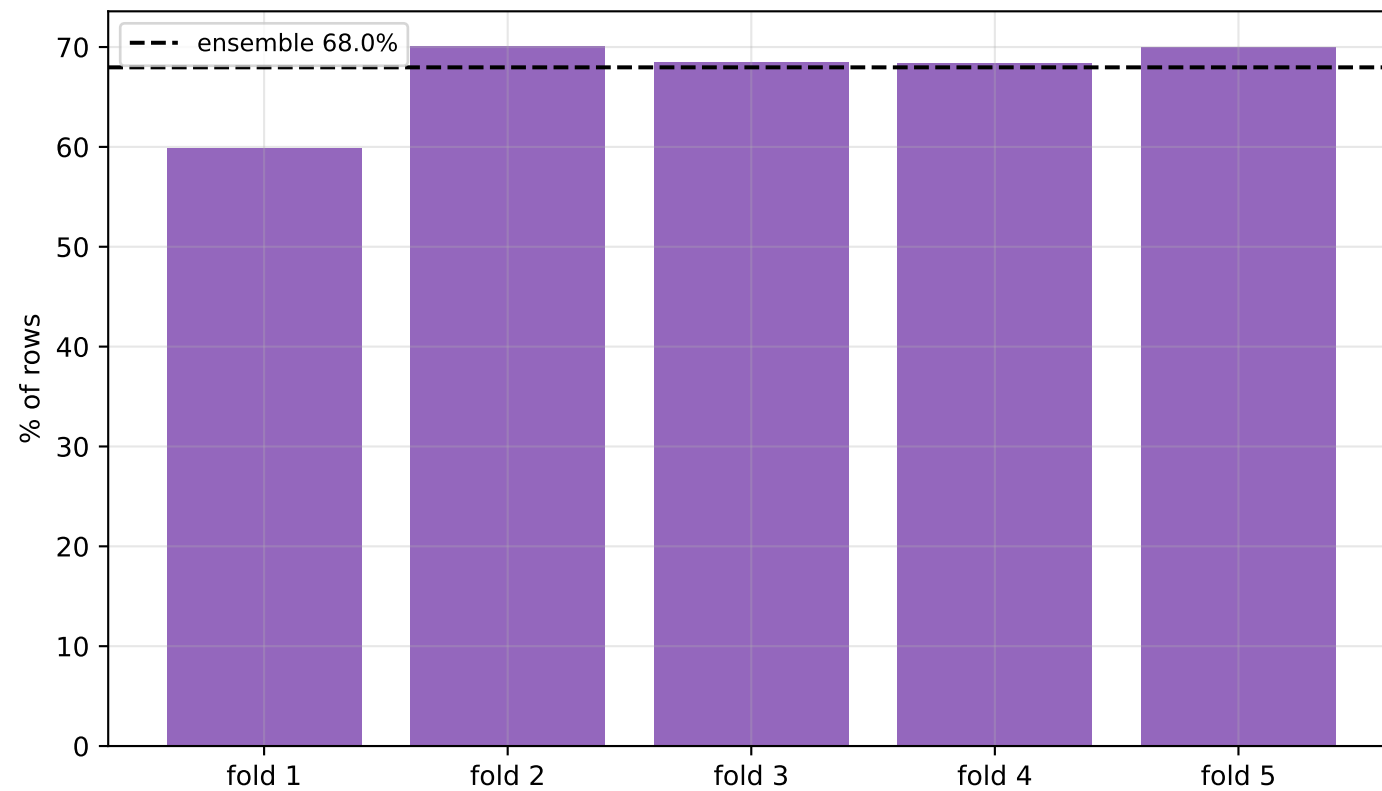

Uncalibrated ensemble_anomalous_score — HK clean-sensor
(ranking and shape only; no threshold applied)

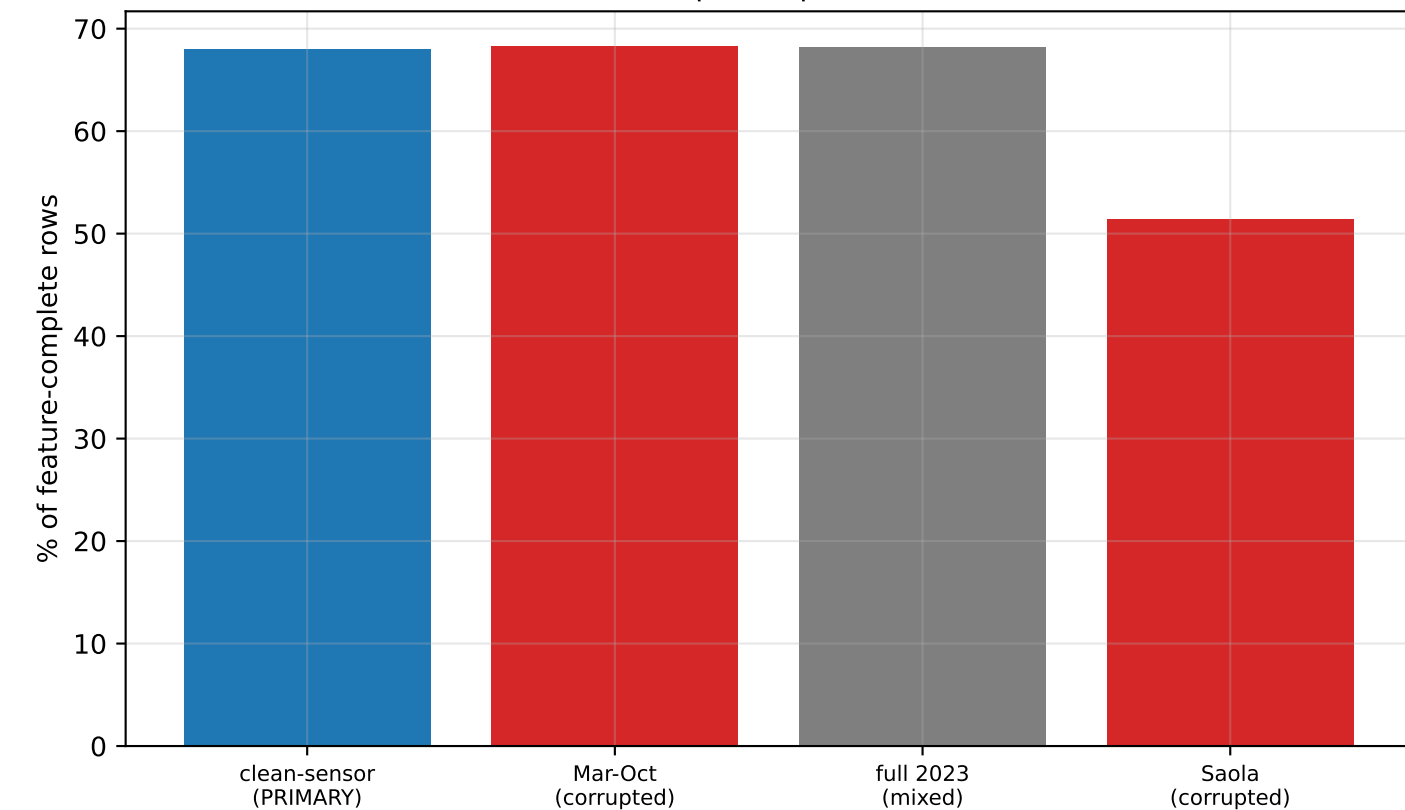

Five-class distribution — neither Brazil distribution is an expected HK prior

Per-fold classifier-screened non-Normal rate
(denominator 4,745 rows)

Screening rate by population
red = corrupted-input stress test

On HK, "anomalous" means classifier-screened non-Normal only — not a verified anomaly. HK has no per-timestamp labels, so the screening rate is a transfer-behaviour statistic and an elevated rate may primarily reflect cross-domain mismatch rather than HK condition. No HK-fitted preprocessing, calibration or threshold was used.
